Aplikasi backup data app android tanpa root

Tired of getting unwanted calls on your phone? You may want to install an app like Nomorobo which says it can stop unwanted calls. But how does it work? I've been an Android user for several years now, and despite my rather than geek background, I've always resisted the call of rooting. Writing this story, however, inspired me to give it a shot. Thanks to the enormous amount of comprehensive, step-by-step instructions available online, I found the rooting process very painless. In less than 45 minutes, you install only root apps to a clean sharp phone free of frustrating bloatware and other unnecessary and frankly foolish software. Not only did my device run faster, I also had more control over the apps I wanted to see and when. Considering that using my phone every day, every day, rooting was definitely a good investment of my time and energy. In addition, I get the satisfaction of knowing that it was set up for my personal tastes and not those of wireless providers. Related articles Algar, C. SciTech Talk: Google to rein in Android. With the right smartphone you can manage emails and appointments, get directions, track your workouts and what you eat, shop, share information with friends, listen to music and watch movies. So why is the smartphone found right so darn confusing? A lot of people feel stupid when choosing a smartphone. Which is the best platform, Android or iPhone? How do you find the best deal on the phone you want when you don't sell every cell phone carrier or works with all models? How can you avoid paying for minutes or data plans you never use? How do you avoid over-charges? Which phones have features worth skipping and which features should have? Do you even need a smartphone or will a regular mobile phone do? Smartphones aren't cheap (nor the plans they sometimes require), so taking the time to do a little research first and find out what you need and want, and can't do without it, is worth it. We'll show you how to narrow down your options, find the right phone, carrier and plan for you until you end up with the right smartphone - and maybe even some money left in your pocket. With these five tips for choosing the right smartphone, you'll be leaving the cell phone store with the right phone and feeling honestly... Well, smart. The contents of this sounds like a very silly statement, but the first step in choosing the right smartphone is to make sure you actually need one. Smartphones are expensive, as are the coverage plans they require. It's easy to use more data than your plan allows and ends up with expensive overtime charges. Even if you don't go over, you may end up paying for a data plan that you're barely using. So, how do you know if you need a smartphone? See how you use your current cell phone you're probably just using your phone to talk and an occasional text message. If you already have a GPS and MP3 player, you can do with a regular phone that does not offer music or directions. You may not want to send an email to your phone. Getting a smartphone often means instant access to business emails, social media and the web. Not everyone wants to be connected to that ad on the other hand, and think about how you want to use your phone. If you hate feeling like you're missing out on the latest tweets and updates from your friends and news, it's likely that your smartphone is worth it. If your job requires you to be All the time, provide instant responses to emails, questions, and smartphone makes sense. You may already have an MP3 player and GPS, but having all these features in one useful device can make life easier and less cluttered. Finally, if your lifestyle has long commutes on public transport, or if you have a lot of stopwork when you are in public, your smartphone can help you pass the time. Cell phone companies are almost as confusing as the phones they offer. All of them have different plans, working with manufacturers of different phones, different levels of service and coverage. You also have to decide whether you are willing to pay while using a smartphone, or if you want to be locked in a contract. Having a contract can save you some money, but that means sticking to a cell phone company for years. If you choose the wrong company or plan and sign a contract, you are stuck. To find the right cell phone company, check out which company has the best coverage where you live. Having a big smartphone doesn't make sense if you can't connect to the internet or constantly drop calls. Look at the coverage maps available at any cell phone carrier location. In addition to making sure your area is well covered, make sure you have the network you want in your area. Smartphones tend to work better on faster 3G and 4G networks. If only a slower network is available in your area, you might want to find another carrier to get the best out of your phone. You should also make sure you have good coverage in the areas where you travel frequently. Advertising also check consumer feedback from the coverage provided by various networks in your area. A cell phone company may have a network where you live, but it is the actual users who will let you know how strong the signal tends to be, and if the calls get dropped. If the carrier seems to have a great coverage in your area but actual customers say otherwise, take your business elsewhere. You'll also need to compare the different prices and plans offered by airlines in your area. Finding the best combination of price and plan is critical to our next tip. Keep reading to find out what it is. When you decide how much to spend on your smartphone, you have costs to consider: the price of the phone and the price of the plan. The price of a phone is a one-time account. Cell phone companies also tend to offer a lot of upgrades and discounts, so the phone you want may be cheaper than you think. In some cases, if you sign up for a specific plan, the phone is free. Before you put your heart on a particular phone, make sure it's priced in line with your budget. In most cases, your smartphone plan will be more cost-effective than your phone. Suppose you had to get a particular phone and you agreed to pay \$600 for it without discounts. Plan for that phone can work for two years, at more than \$100 a month, you could end up paying four times as much to plan from Advertise before pounding out all that cash every month and think about how you want to use your phone. If you plan to use it mainly for talking and texts, with just a little email or surfing the internet, see if you can find a plan with less data. If you're connected to the Internet and want to download apps, games, and movies, you'll want to search for more data. Other parts of the plan to be considered include whether unused data, texts and spoken minutes roll over from month to month, or what is the penalty for breach of contract. If, for example, you can move from the cell phone carrier coverage area, you don't want to pay hundreds of dollars just to get out of your contract. For many people, choosing the right smartphone is a matter of choosing the right operating system. The smartphone operating system is the platform it uses to run different programs. While it can pretty much hit you pretty much on the internet, email, phone calls and texts, and for both strengths and weaknesses. Four of the most common operating systems for smartphones today are Apple's iOS, which runs the iPhone, Google's Android system, Microsoft's Windows Mobile and research into The BlackBerry Os Motion. What you'll notice, however, is the availability of different programs and applications across different platforms. Advertising if you plan to use a lot of apps on your smartphone, you may want to avoid getting a BlackBerry. The BlackBerry operating system is great for using email and web browsing, but does not have as many applications as other browsers. If you want a lot of apps, the iPhone is your best bet. Apple's app store is the largest in the world. The downside of Apple's operating system is that it is only available on Apple's iPhones. Android phones quickly make up the ground against Apple where apps are concerned, and the Android operating system is available on a range of phones, making it easier to find one that fits your life perfectly. Windows Mobile Phone is good to get if you plan to do a lot of work on your phone. Since it runs a mobile version of Windows, which you may already have running on your computer, it can allow you to easily see and work on spreadsheets and documents on your phone. Once you decide your phone budget, operating system, carrier and plan, you have one task left: make a decision on the phone. Take your time in this phone may end up having two years, take it everywhere with you and use it more than any other device. You need to make sure that the actual phone suits your life. Check out all the carrier phones you're going with has in your price range and with the operating system you want. Think about the tasks you plan to use your phone, and try to get out of them on the in-store demophones. See if the main board is comfortable, and how easy it is to switch between applications. If your phone has a tracking ball or touch screen, see if it's easy Use or if you're constantly clicking on the wrong thing. Make sure that the phone will fit comfortably in your hand as well as your pocket or wallet. Also make sure you love the look of the phone - after all, it will be your constant accessory. Put the phone on your ear and make sure it's comfortable too. If you know people who have a phone you care about, ask them about it. Also read online user reviews to see if your phone has problems such as getting hot after prolonged use, or breaking easily. Ad follow these tips and your next smartphone won't just be smart - it'll be genius. MIT AlterEgo allows people to control computers without saying a word.
